

DIGITAL AUTOMATIC GAIN CONTROL

Abstract

Systems, devices, and methods are provided to inhibit apparent amplitude
5 modulation in non-linear processing that causes distortion in a processed signal.
One aspect of the invention includes a hearing aid. The hearing aid includes a
microphone to receive an input signal, a speaker to reproduce the input signal, and
a processor. The processor processes the input signal using a gain. The processor
includes an inhibitor, which inhibits distortions, and an adjuster, which adjusts the
10 gain. The inhibitor acts to smooth an envelope of the input signal to inhibit
undesired modulation. The adjuster adjusts the gain if the envelope is either above
or below a threshold.
